

ABSTRACT

Employee promotion plays an important role in an organization. It aids to inspire employees to grow and develop their skills, thus increase employee loyalty and reduce the turnover rate. This study predicts employee job promotion based on employee promotion data. The purpose of this study is to accelerate the promotion process and share the important features that might be determined when promoting an employee.

The Employee Promotion Analysis system aims to identify key factors determining employee promotions within an organization. Traditional promotion systems often rely on subjective evaluations, leading to potential biases and inefficiencies. By analysing factors such as employee performance metrics, and skill sets, the system ensures that promotions are based on merit and organizational needs. The project involves multiple stages which includes data collection, preprocessing, model training, and deployment using tools like Django and SQLite.

The system's user-friendly interface, developed with HTML, CSS, and Bootstrap, enhances the usability and accessibility for HR professionals. The analysis process involves identifying trends and patterns within historical data, enabling predictive insights. Furthermore, the inclusion of data-driven algorithms reduces the influence of human error and bias, fostering a fairer promotion process.

This comprehensive approach integrates technical efficiency with organizational strategy. The deployment of this system contributes to enhanced transparency, reduced turnover rates, and increased employee satisfaction. By empowering HR departments with actionable insights, the system bridges the gap between employee aspirations and organizational goals.

INTRODUCTION

Employee promotion decisions are critical to the growth and efficiency of any organization. Traditionally, promotion decisions have relied on manual evaluations, which can unintentionally introduce biases or fail to recognize deserving candidates. This project seeks to address these limitations by implementing a data-driven framework designed to assess employee promotion eligibility in a structured and objective manner.

The **Employee Promotion Analysis** system incorporates cutting-edge technology and advanced analytical techniques to evaluate key factors such as employee performance, tenure, and other relevant attributes. By utilizing tools like Django, SQLite, and sophisticated machine learning models, this system ensures that promotion decisions align with both organizational objectives and individual contributions.

One of the key features of this project is its ability to uncover patterns and trends from historical data, providing predictive insights into employees' career progression. Additionally, the system offers a user-friendly web interface built with HTML, CSS, and Bootstrap, making it easy for HR professionals to access and navigate. The automation of data preprocessing, feature extraction, and analysis helps reduce human error, improving the accuracy of the decision-making process. Specifically, the project employs the **Gaussian Naive Bayes** algorithm for predictive modeling, enabling effective forecasting of promotion outcomes based on historical data.

This supervised machine learning algorithm is effective in handling high-dimensional data and provides probabilistic predictions based on Bayes' theorem. By classifying employees into promotion-eligible or ineligible categories, the system delivers insights that are both actionable and precise. The algorithm's efficiency and simplicity make it an best choice for this application, ensuring accurate predictions with minimal computational overhead.

This initiative not only enhances transparency but also fosters a culture of excellence within the organization, ensuring that promotions are granted based on merit and performance rather than subjective evaluations. As a result, it contributes to higher employee satisfaction, reduced attrition, and sustained organizational growth.

CHAPTER 1

SIGNIFICANCE OF THE PROBLEM AND PROBLEM DESCRIPTION

Employee promotion decisions significantly impact both individual career growth and overall organizational efficiency. Bad decision promotion policies leave the company employees dissatisfied, lower their interest, and increase in turnover rates. When companies depend on old methods which is outdated, it can lead to biased decisions, preventing the employees who deserve the promotion.

My project tackles the problem of improper promotion practices. Many companies find it difficult to properly use performance metrics, past data, and other factors in the decision-making process. The outcome is they miss opportunities to increase workforce potential and align promotions with their goals.

This analysis system resolves these challenges using advanced data analytics and ML. It analyzes various factors like experience, training, etc to offer fair and unbiased promotion predictions. By leveraging a probabilistic model like Gaussian Naive Bayes, it guarantees that decisions are supported by statistical rigor and data insights.

This project highlights the significance of fair and transparent promotion practices, developing a culture of trust and meritocracy. The system's ability to automate and streamline the analysis process not only saves time for HR professionals but also provides a higher degree of accuracy and consistency in decision-making.

CHAPTER 2

FUNCTIONALITIES

An Employee Promotion Analysis system is designed to provide a comprehensive, data-driven solution for evaluating promotion eligibility. It achieves this through a combination of analytical tools, machine learning models, and user-friendly interfaces.

The proposed system integrates the following functionalities:

- **UI:** Built with HTML, CSS, JavaScript, and Bootstrap for an interactive experience.
- **Database:** SQLite Studio for seamless data management.
- **Framework:** Django for backend processing and integration.
- **Preprocessing:** Data cleaning and preparation for model development.
- **Admin Module:** Provides administrators with tools to view the history of all promotion predictions, manage system settings, and oversee user activity.
- **User Module:** Enables users to register, log in, and perform promotion predictions based on their input data.

Dataset:

The dataset used in this system includes various features that help evaluate employee promotion eligibility. These features include:

- **Department:** The department in which the employee works.
- **Education:** The highest level of education attained by the employee.
- **Gender:** The gender of the employee.
- **Recruitment Channel:** The channel through which the employee was hired (e.g., internal referral, external recruitment).
- **Training Count:** The number of training sessions the employee has attended.
- **Age:** The age of the employee.
- **Previous Ratings:** The employee's performance ratings from previous appraisals.
- **Length of Service:** The duration of the employee's service in the organization.
- **Awards Won:** The number of awards the employee has won during their tenure.
- **Average Training Scores:** The combined score of the employee's training sessions.

is_promoted serves as the target variable, indicating whether the employee was promoted based on the assessment of the above features.

Predictive Modeling and Machine Learning

The predictive modeling component of the system involves several key steps to ensure the precision and dependability of promotion predictions:

- **Model Selection:** The system uses the **Gaussian Naive Bayes** ML algorithm as the primary ML model. It is selected due to its simplicity, efficiency, and effectiveness in handling high-dimensional data, which is essential for evaluating multiple features such as performance ratings, training history, and employee demographics.
- **Feature Importance:** A key aspect of the analysis is identifying what features contribute most to the prediction of promotions. Feature importance reveals which factors are most important in influence on promotion decisions. This can generate valuable information to HR professionals on which employee attributes should be prioritized for future evaluations.
- **Real-Time Predictions:** The system is designed to allow for real-time predictions. HR professionals can input employee data through the web interface, and the system will generate an instant prediction regarding the likelihood of promotion. This provides HR departments with a quick, data-driven tool for assessing promotion eligibility on an ongoing basis.

CHAPTER 3

IMPLEMENTATION

The implementation process involved several steps:

1. User Interface Development: Designed using HTML, CSS, and Bootstrap for responsiveness.
2. Database Connection: SQLite was utilized to efficiently store and manage employee data within the system.
3. Model Development: Machine learning algorithms, including the **Gaussian Naive Bayes** classifier, were trained using cleaned and pre-processed data to predict promotion outcomes.
4. Integration: The user interface (UI) and database were seamlessly integrated using Django to ensure smooth functionality and communication between the components.

Technologies Used:

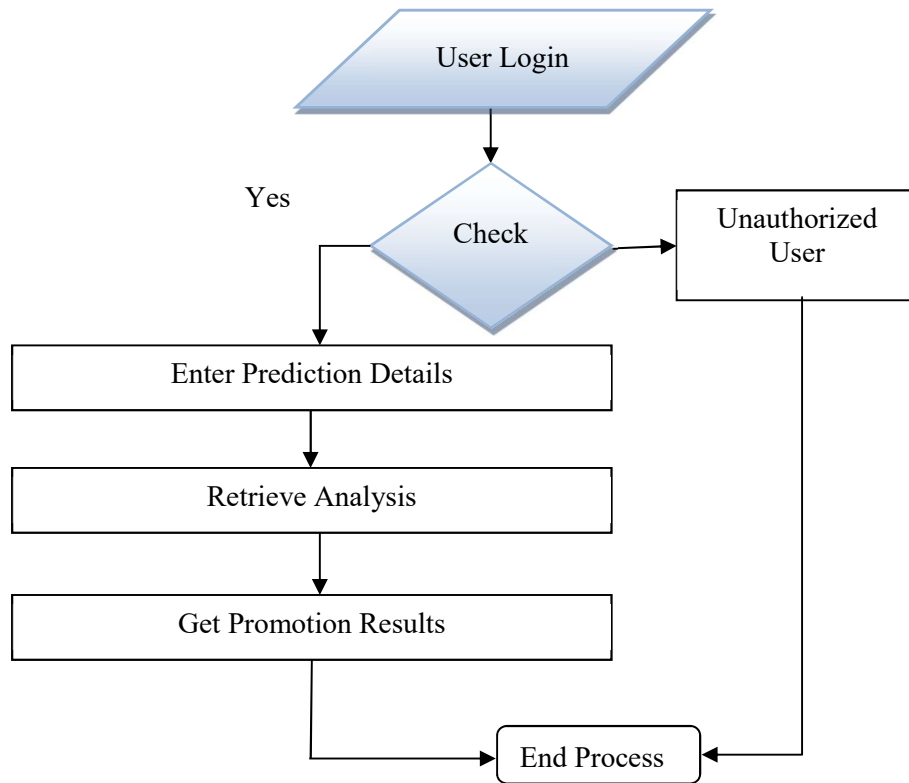

1. Django (Backend Framework):
 - Django is a powerful and flexible Python web framework primarily used for backend development. It was employed to handle the system's business logic, process user requests, manage the database, and provide the necessary APIs to ensure smooth operation of the application.
2. SQLite (Database):
 - SQLite was selected as the database management system due to its resource-efficient and lightweight nature. Being a file-based database, SQLite integrates seamlessly with Django, allowing for fast and reliable data storage and retrieval. It efficiently handles employee data in this project.
3. Python (Programming Language):
 - Python served as the primary programming language for system development, especially in implementing machine learning algorithms. With its extensive library support for data analysis, machine learning, and backend development, Python was the optimal choice for building this system.

4. HTML, CSS, and Bootstrap (Frontend Technologies):

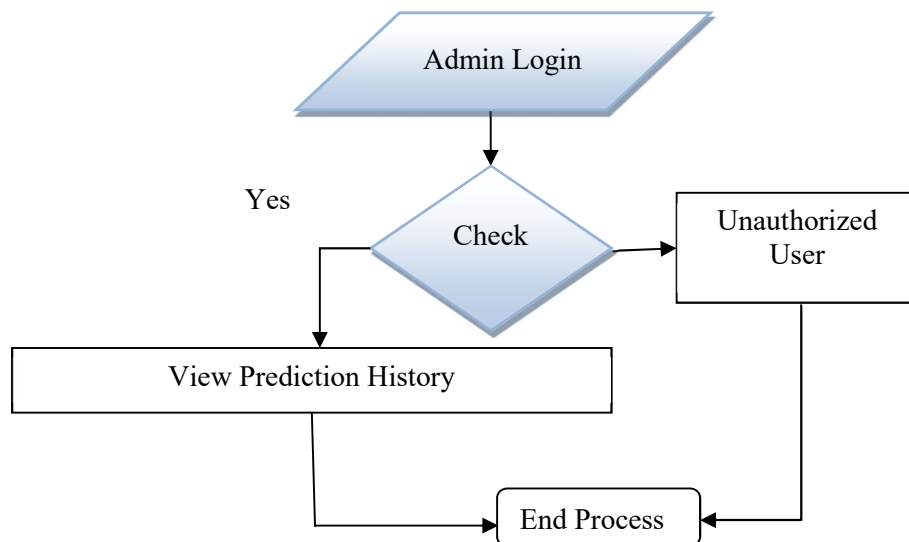

- HTML was used for structuring the web pages, CSS for styling, and Bootstrap for building a responsive and user-friendly interface.

RESULTS AND DISCUSSIONS

Screenshots

Home Page:

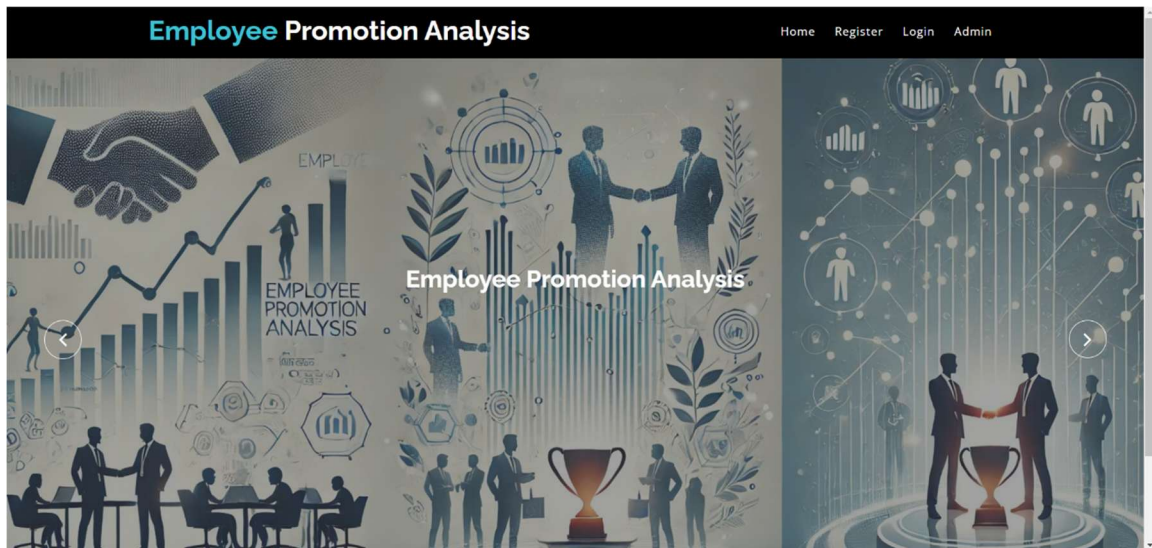

Figure 4.1 Home Page

User Register Page:

The screenshot shows the user registration page. The header is identical to the home page. Below the header, the word "Register" is centered and underlined. The registration form consists of several input fields: a first name field containing "Kushal", a last name field containing "Balaji V", an email field containing "kush", and a password field containing "kushalbalaji66@gmail.com". There are two more empty input fields, likely for a confirm password and a phone number, each preceded by a series of asterisks. A green "Register" button is positioned below the form fields.

Figure 4.2 Register Page: User can register in this page for this website after providing few details.

User Login Page:

The screenshot shows the 'Employee Promotion Analysis' website's login page. The header is black with the site name in teal and white, and navigation links for Home, Register, Login, and Admin. The main heading 'Login' is centered. Below it are two input fields: the first contains the username 'kush' and the second contains masked characters '*****'. A green 'Login' button is positioned below the password field.

Figure 4.3 Login Page: User can login in this website after providing registering.

Prediction Page:

The screenshot displays the 'Predict Employee Promotion' page. The header is black with the site name and navigation links for Home, Welcome Kushal, Predict, and Logout. The main heading 'Predict Employee Promotion' is centered. Below it is a vertical stack of ten light blue input fields containing the following text from top to bottom: 'Operations', 'Master's & above', 'm', 'Sourcing', '2', '30', '4', '10', '1', and '80'. A green 'PREDICT' button is located at the bottom center of the form.
